

## ABSTRACT

5 A presentation of a selected document, stored at a  
node of a network, is accomplished by means of a system  
essentially comprising a handheld device, a communication  
device for a presentation unit and a device that handles  
presentation requests. By operating the handheld device,  
10 a user is able to get a presentation unit specification  
from said communication device. This specification is  
then sent, together with an address to a selected  
document, to a device handling presentation requests. In  
this device the selected document is then converted to a  
15 format suitable for the presentation unit of said  
communication device, where the converted document is  
presented. The system could be using WAP-technology for  
sending information from the handheld device to the  
device that handles presentation requests and for  
20 accessing information on the Internet. Further the system  
could, for example, be using Bluetooth or IrDA for the  
communication between the handheld device and said  
communication device. The system also makes it possible  
to achieve mobile printing and portable access to  
documents that cannot be presented on a small display.
